[301] Lists

Tyler Caraza-Harter

Learning Objectives Today

Lists, the mutable sequence that can hold ANYTHING!

Sequence stuff
- indexing, slicing, for loops
- len, in, concatenation, multiplication

Chapter 10 of Think Python

Mutating!
- update, append, pop, sort

Switching between strings and lists
- split, join
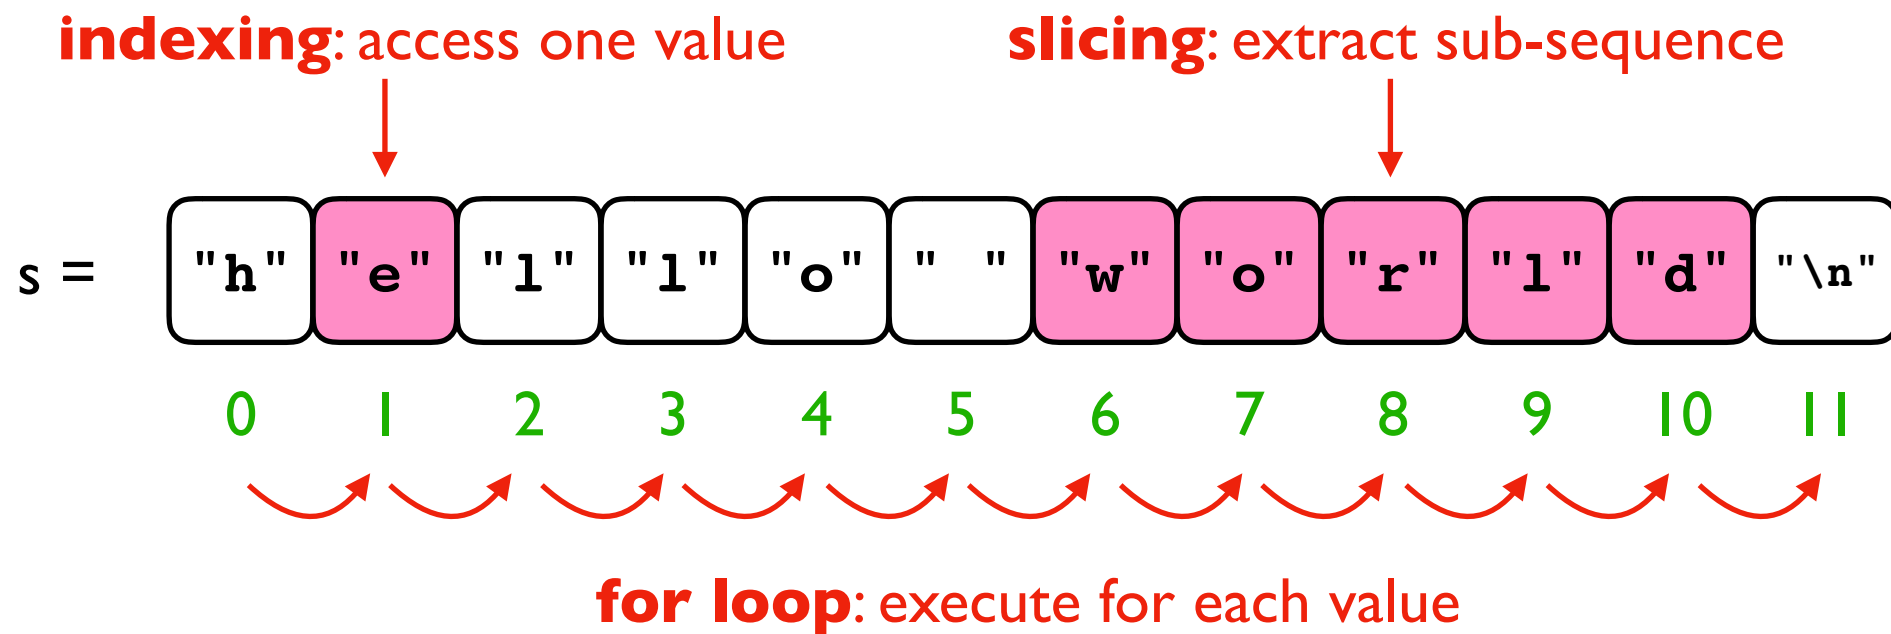

Today's Outline

From Strings to Lists

More Sequence Capabilities

Difference 1: Flexibility of Types

Difference 2: Mutability

Transforming between Strings and Lists

A string is a **sequence** of characters

indexing: access one value   **slicing**: extract sub-sequence

s = | "h" | "e" | "l" | "l" | "o" | " " | "w" | "o" | "r" | "l" | "d" | "\n" |

0   1   2   3   4   5   6   7   8   9   10   11

for loop: execute for each value

Things we can do with sequences
- indexing
- slicing
- for loop

A string is a **sequence** of characters

```
>>> msg = "hi world!"
```

Things we can do with sequences
- indexing
- slicing
- for loop

A string is a **sequence** of characters

```
>>> msg = "hi world!"
>>> msg[1]
```

Things we can do with sequences
- **indexing**
- slicing
- for loop

A string is a **sequence** of characters

```
>>> msg = "hi world!"
>>> msg[1]
'i'
```

Things we can do with sequences
- **indexing**
- slicing
- for loop

A string is a **sequence** of characters

```
>>> msg = "hi world!"
>>> msg[1]
'i'
>>> msg[3]
```

Things we can do with sequences
- **indexing**
- slicing
- for loop

A string is a **sequence** of characters

```
>>> msg = "hi world!"
>>> msg[1]
'i'
>>> msg[3]
'w'
```

Things we can do with sequences
- **indexing**
- slicing
- for loop

A string is a **sequence** of characters

```
>>> msg = "hi world!"
>>> msg[3:]
```

Things we can do with sequences
- indexing
- **slicing**
- for loop

A string is a **sequence** of characters

```
>>> msg = "hi world!"
>>> msg[3:]
'world!'
```

Things we can do with sequences
- indexing
- **slicing**
- for loop

A string is a **sequence** of characters

```
>>> msg = "hi world!"
>>> msg[3:]
'world!'
>>> msg[3:-1]
```

Things we can do with sequences
- indexing
- **slicing**
- for loop

A string is a **sequence** of characters

```
>>> msg = "hi world!"
>>> msg[3:]
'world!'
>>> msg[3:-1]
'world'
```

Things we can do with sequences
- indexing
- **slicing**
- for loop

A string is a **sequence** of characters

```
>>> msg = "hi world!"
>>> for c in msg:
...     print(c)
...
h
i

w
o
r
l
d
!
```

Things we can do with sequences
- indexing
- slicing
- **for loop**

A string is a **sequence** of characters

```
>>> msg = "hi world!"
```

What if we want a sequence, of something
other than characters?

Use a Python `list`, with any items we want!

A string is a **sequence** of characters

sequence of characters

```
>>> msg = "hi world!"
```

str syntax

start with
quote

end with
quote

What if we want a sequence, of something
other than characters?

Use a Python `list`, with any items we want!

A list is a **sequence** of *anything*

```
>>> msg = "hi world!"          str syntax
>>> nums = [22, 11, 33]        list syntax
```

↑ square bracket instead of quote

sequence of values, comma separated

↑ square bracket instead of quote

What if we want a sequence, of something other than characters?

Use a Python list, with any items we want!

A list is a **sequence** of *anything*

```
>>> nums = [22, 11, 33]
```

Things we can do with sequences
- indexing
- slicing
- for loop

A list is a **sequence** of *anything*

```
>>> nums = [22, 11, 33]
>>> nums[0]
22
```

Things we can do with sequences
- **indexing**
- slicing
- for loop

A list is a **sequence** of *anything*

```
>>> nums = [22, 11, 33]
>>> nums[0]
22
>>> nums[-1]
33
```

Things we can do with sequences
- **indexing**
- slicing
- for loop

A list is a **sequence** of *anything*

```
>>> nums = [22, 11, 33]
>>> [22, 11, 33][1]
11
```

seeing brackets for both creating lists and indexing often confuses new coders!

Things we can do with sequences
- **indexing**
- slicing
- for loop

A list is a **sequence** of *anything*

```
>>> nums = [22, 11, 33]
>>> nums[1:]
[11, 33]
```

Things we can do with sequences
- indexing
- **slicing**
- for loop

A list is a **sequence** of *anything*

```
>>> nums = [22, 11, 33]
>>> nums[1:]
[11, 33]
>>> nums[3:]
```

Things we can do with sequences
- indexing
- **slicing**
- for loop

A list is a **sequence** of *anything*

```
>>> nums = [22, 11, 33]
>>> nums[1:]
[11, 33]
>>> nums[3:]
[]
```

Things we can do with sequences
- indexing
- **slicing**
- for loop

A list is a **sequence** of *anything*

```
>>> nums = [22, 11, 33]
>>> for x in nums:
...     print(x)
...
22
11
33
```

Things we can do with sequences
- indexing
- slicing
- **for loop**

Demo: Finding a Sum

Goal: write a function to add a list of numbers

Input:
- Python list containing floats

Output:
- Sum of the numbers

Example:
```
>>> nums = [1, 2, 3.5]
>>> add_nums(nums)
6.5
>>> add_nums([20, 30.1])
50.1
```

Today's Outline

From Strings to Lists

More Sequence Capabilities

Difference 1: Flexibility of Types

Difference 2: Mutability

Transforming between Strings and Lists

Cool stuff we can do with ~~strings and lists~~

any sequence

1 indexing

2 slicing

3 for loops

4 len

5 concatenation

6 in

7 multiply by an int

4. len(sequence)

string

```
>>> msg = "321go"
>>> len(msg)
5
```

list

```
>>> items = [99,11,77,55]
>>> len(items)
4
```

5. concatenation

string

```
>>> msg = "321go"
>>> msg + "!!!"
'321go!!!'
```

list

```
>>> items = [99,11,77,55]
>>> items + [1,2,3]
[99,11,77,55,1,2,3]
```

6. in

string

```
>>> msg = "321go"
>>> 'g' in msg
True
```

list

```
>>> items = [99,11,77,55]
>>> 11 in items
True
```

6. in

string

```
>>> msg = "321go"
>>> 'g' in msg
True
>>> 'z' in msg
False
```

list

```
>>> items = [99,11,77,55]
>>> 11 in items
True
>>> 10 in items
False
```

7. multiply by int

string

```
>>> msg = "321go"
>>> msg * 2
'321go321go'
```

list

```
>>> items = [99,11,77,55]
>>> items * 2
[99,11,77,55,99,11,77,55]
```
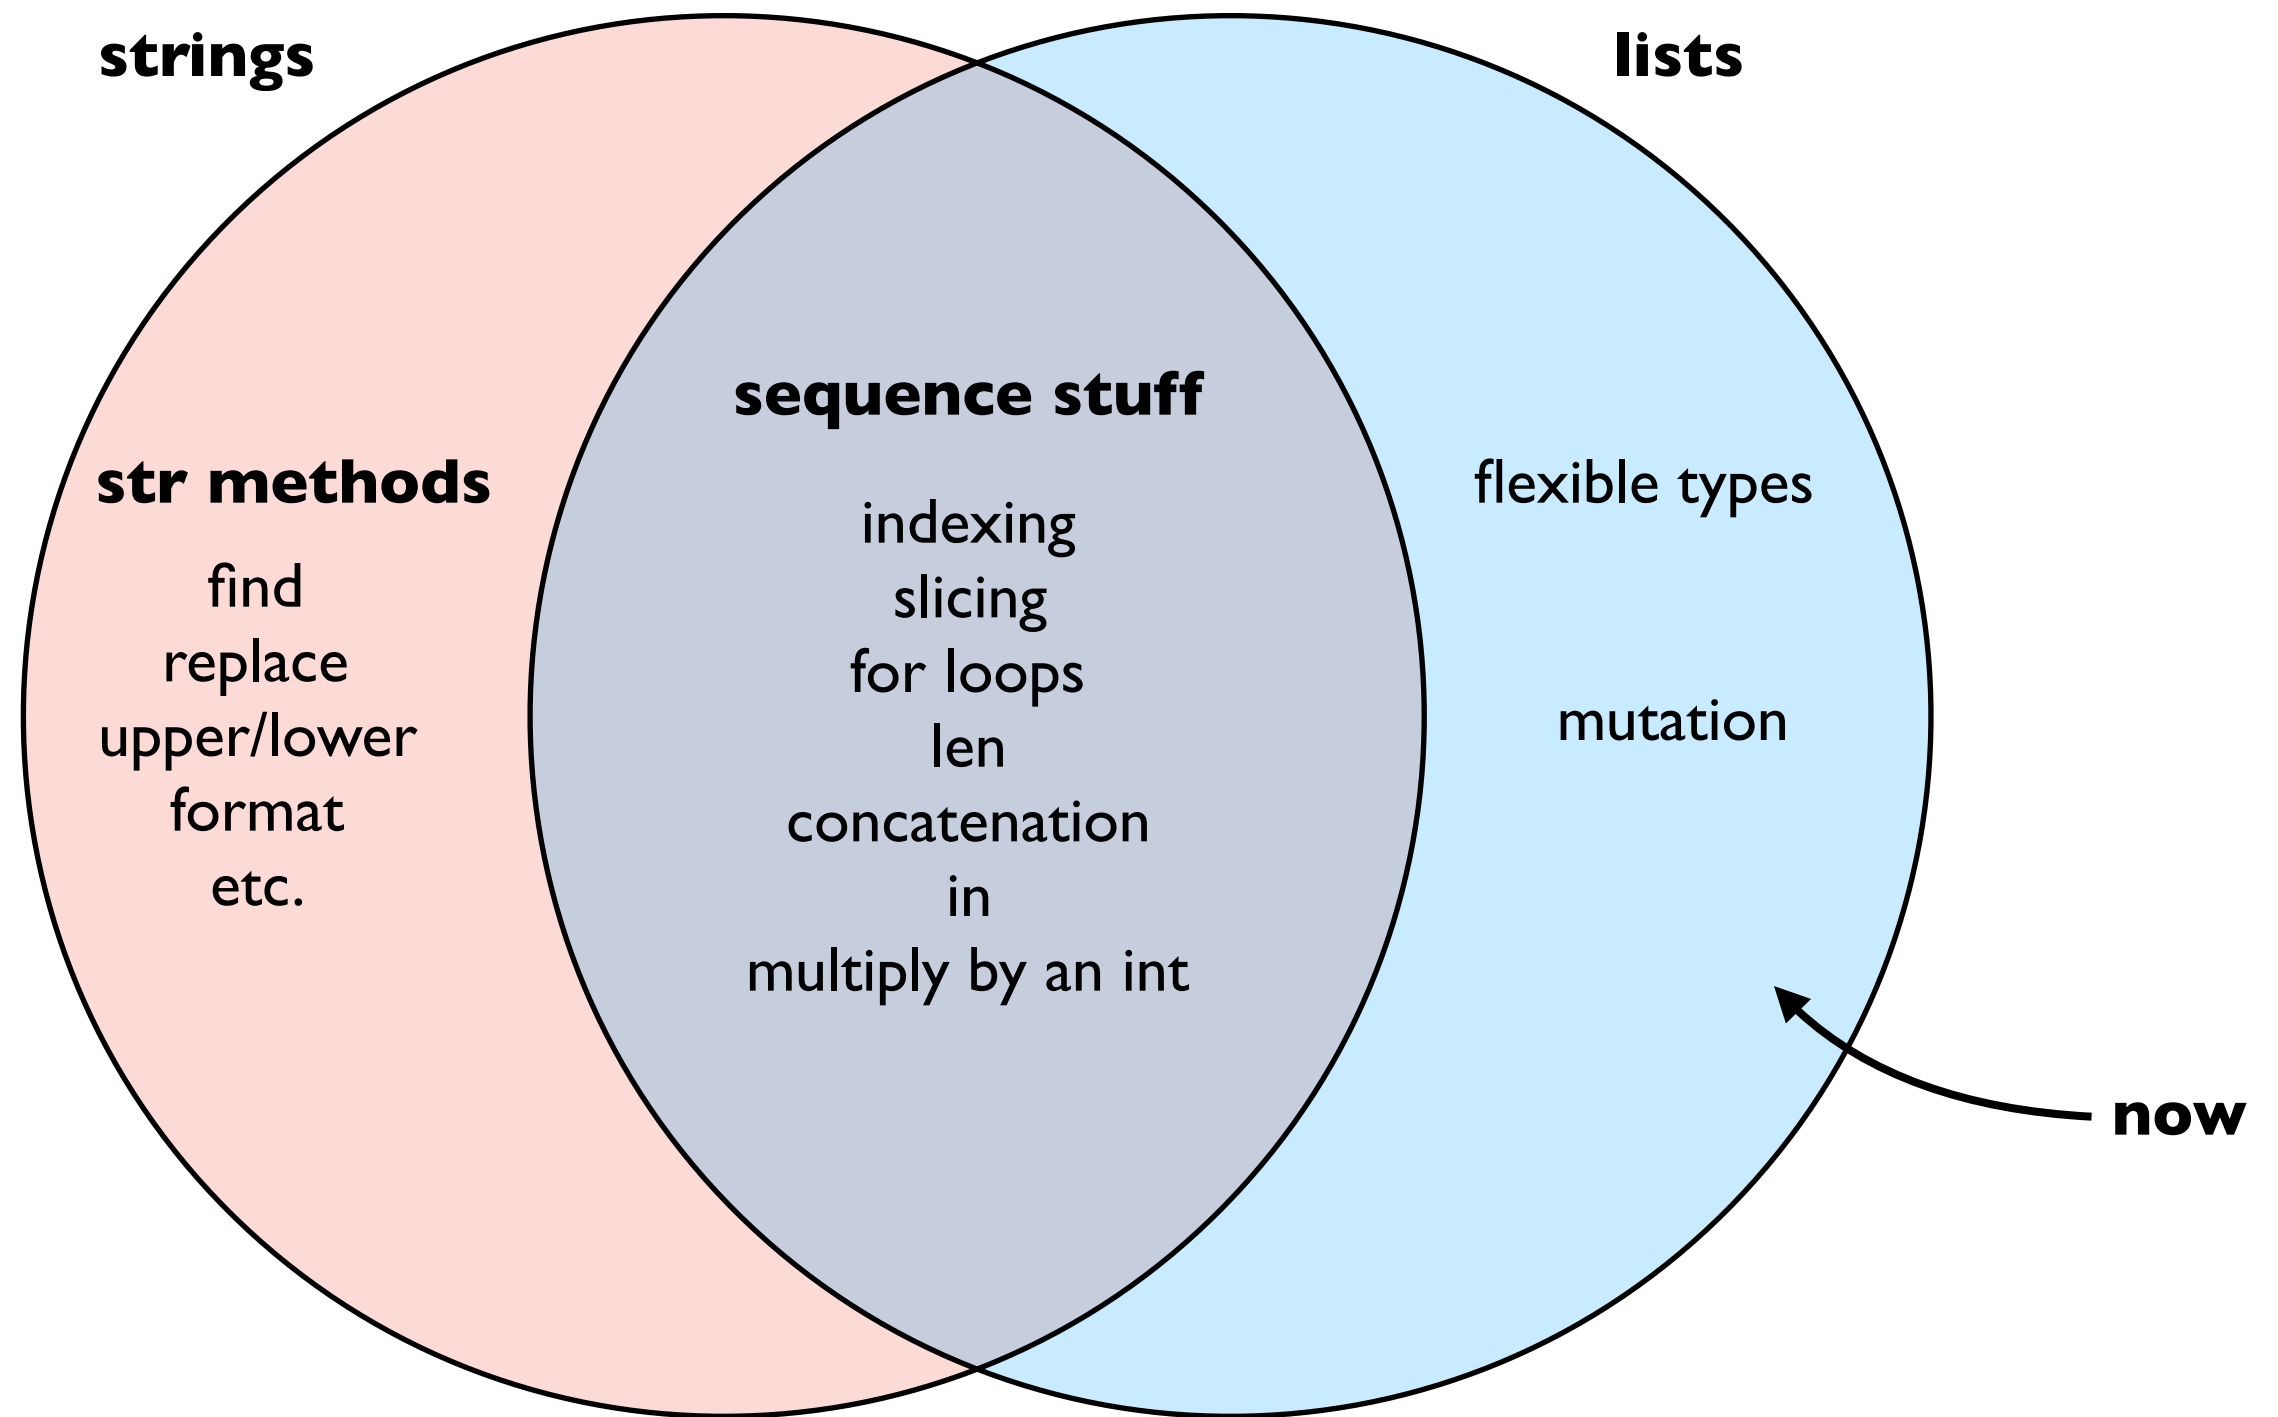

strings

lists

str methods

find
replace
upper/lower
format
etc.

sequence stuff

indexing
slicing
for loops
len
concatenation
in
multiply by an int

flexible types

mutation

now

Today's Outline

From Strings to Lists

More Sequence Capabilities

Difference 1: Flexibility of Types

Difference 2: Mutability

Transforming between Strings and Lists

Items can be any types

string, bool, int, float

even other lists!

coding demo:

```
l = [True, False, 3, "hey", [1, 2]]
for item in l:
    print(type(l))
```

bonus: how to extract the last item of the last item?

Example game map with list of lists

```
[
  [".", ".", ".", ".", ".", "S"],
  [".", "S", "S", "S", ".", "S"],
  [".", ".", ".", ".", ".", "S"],
  [".", ".", ".", ".", ".", "."],
  [".", ".", ".", ".", "S", "."],
  [".", ".", ".", ".", "S", "."]
]
```

```
.....S
.SSS.S
.....S
......
....S.
....S.
```

*rows and columns
of data are useful for
more than games...*

Today's Outline

From Strings to Lists

More Sequence Capabilities

Difference 1: Flexibility of Types

Difference 2: Mutability

Transforming between Strings and Lists

Mutability

Definition

- a type is **mutable** if values can be changed
- a type is **immutable** if values cannot be changed

careful! this is is about *values*, not *variables*
(variables can ALWAYS be changed)

	set variable to new value	change existing value
list (mutable)	`nums = [1,2]` `nums += [3]` ✔	`nums = [2,0,1]` `nums[0] = 3` ✔
str (immutable)	`s = "AB"` `s += "C"` ✔	`s = "201"` `s[0] = "3"` ✘

Ways to mutate a list

Common Modifications
- L[index] = new_value
- L.append(new_value)
- L.extend(another_list)
- L.pop(index)
- L.sort()

Example code:

```
L = [3,2,1]
L.append(0)
L.extend([9, 8])
L[1] = -1
L.sort()
L.pop(0)
```

*Demo these in
PythonTutor*

Demo: Finding a Median

Goal: write a function to find the median of a list of numbers

Input:
- Python list containing floats

Output:
- The median

Example:
```
>>> nums = [1,5,2,9,8]
>>> median(nums)
5
>>> median([1, 20, 30, 100])
25
```

Today's Outline

From Strings to Lists

More Sequence Capabilities

Difference 1: Flexibility of Types
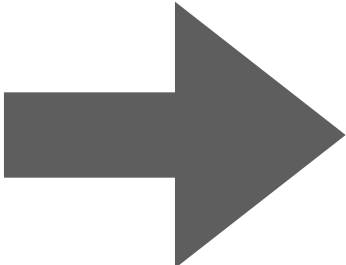

Difference 2: Mutability

Transforming between Strings and Lists

split method

```
S = "a quick brown fox"
L = S.split(" ")
```

separator

"a quick brown fox" → ["a", "quick", "brown", "fox"]

join method

```
L = ["M", "SS", "SS", "PP", ""]
S = "I".join(L)
```
separator

```
["M", "SS", "SS", "PP", ""]
```
→ ????

join method

```
L = ["M", "SS", "SS", "PP", ""]
S = "I".join(L)
```
separator

["M", "SS", "SS", "PP", ""] ➡ MISSISSIPPI

join method

```
L = ["M", "SS", "SS", "PP", ""]
S = "I".join(L)
```
separator

what if removed?

`["M", "SS", "SS", "PP", ""]` ➡ MISSISSIPPI

join method

```
L = ["M", "SS", "SS", "PP"]
S = "I".join(L)
```

separator

```
["M", "SS", "SS", "PP", ""]
```

MISSISSIPP

Demo: Censoring Profanity

Goal: write a function to replace curse words with stars

Input:
- A profane string

Output:
- A sanitized string

Example:

>>> censor("OMG this class is so fun")
'*** this class is so fun'
>>> censor("the midterm is darn soon")
'the ******* was **** tough'

Demo: Censoring Profanity

Goal: write a function to replace curse words with stars

Input:
- A profane string

Output:
- A sanitized string

Example:

```
>>> censor("OMG this class is so fun")
'*** this class is so fun'
>>> censor("the midterm is darn soon")
'the ******* was **** tough'
```

replaces offensive words like "darn" and "midterm" with stars

Bonus Topics (time permitting)...

1. Command line arguments, as a list

```
import sys
arg1 = sys.argv[1]
arg2 = sys.argv[2]
```

2. Random values, from a list

```
import random
random.choice(["rock", "paper", "scissors"])
```
